UROME

September 15th, 2020

Funded by the European Union's Horizon 2020  
Research and Innovation Programme, under Grant Agreement no 826293

# DRMP in a nutshell

- DRMP aims to proactively protect a complex IT infrastructure by taking the following main steps
  - Risk Analysis
    - ▷ multi-dimensional model to support attack likelihood analysis
    - ▷ Business Dependency Analysis to support impact analysis
  - Response Analysis
    - ▷ Identification of technical and non-technical mitigation actions to reduce the risk level

# Context Overview

## THREATS & VULNERABILITIES

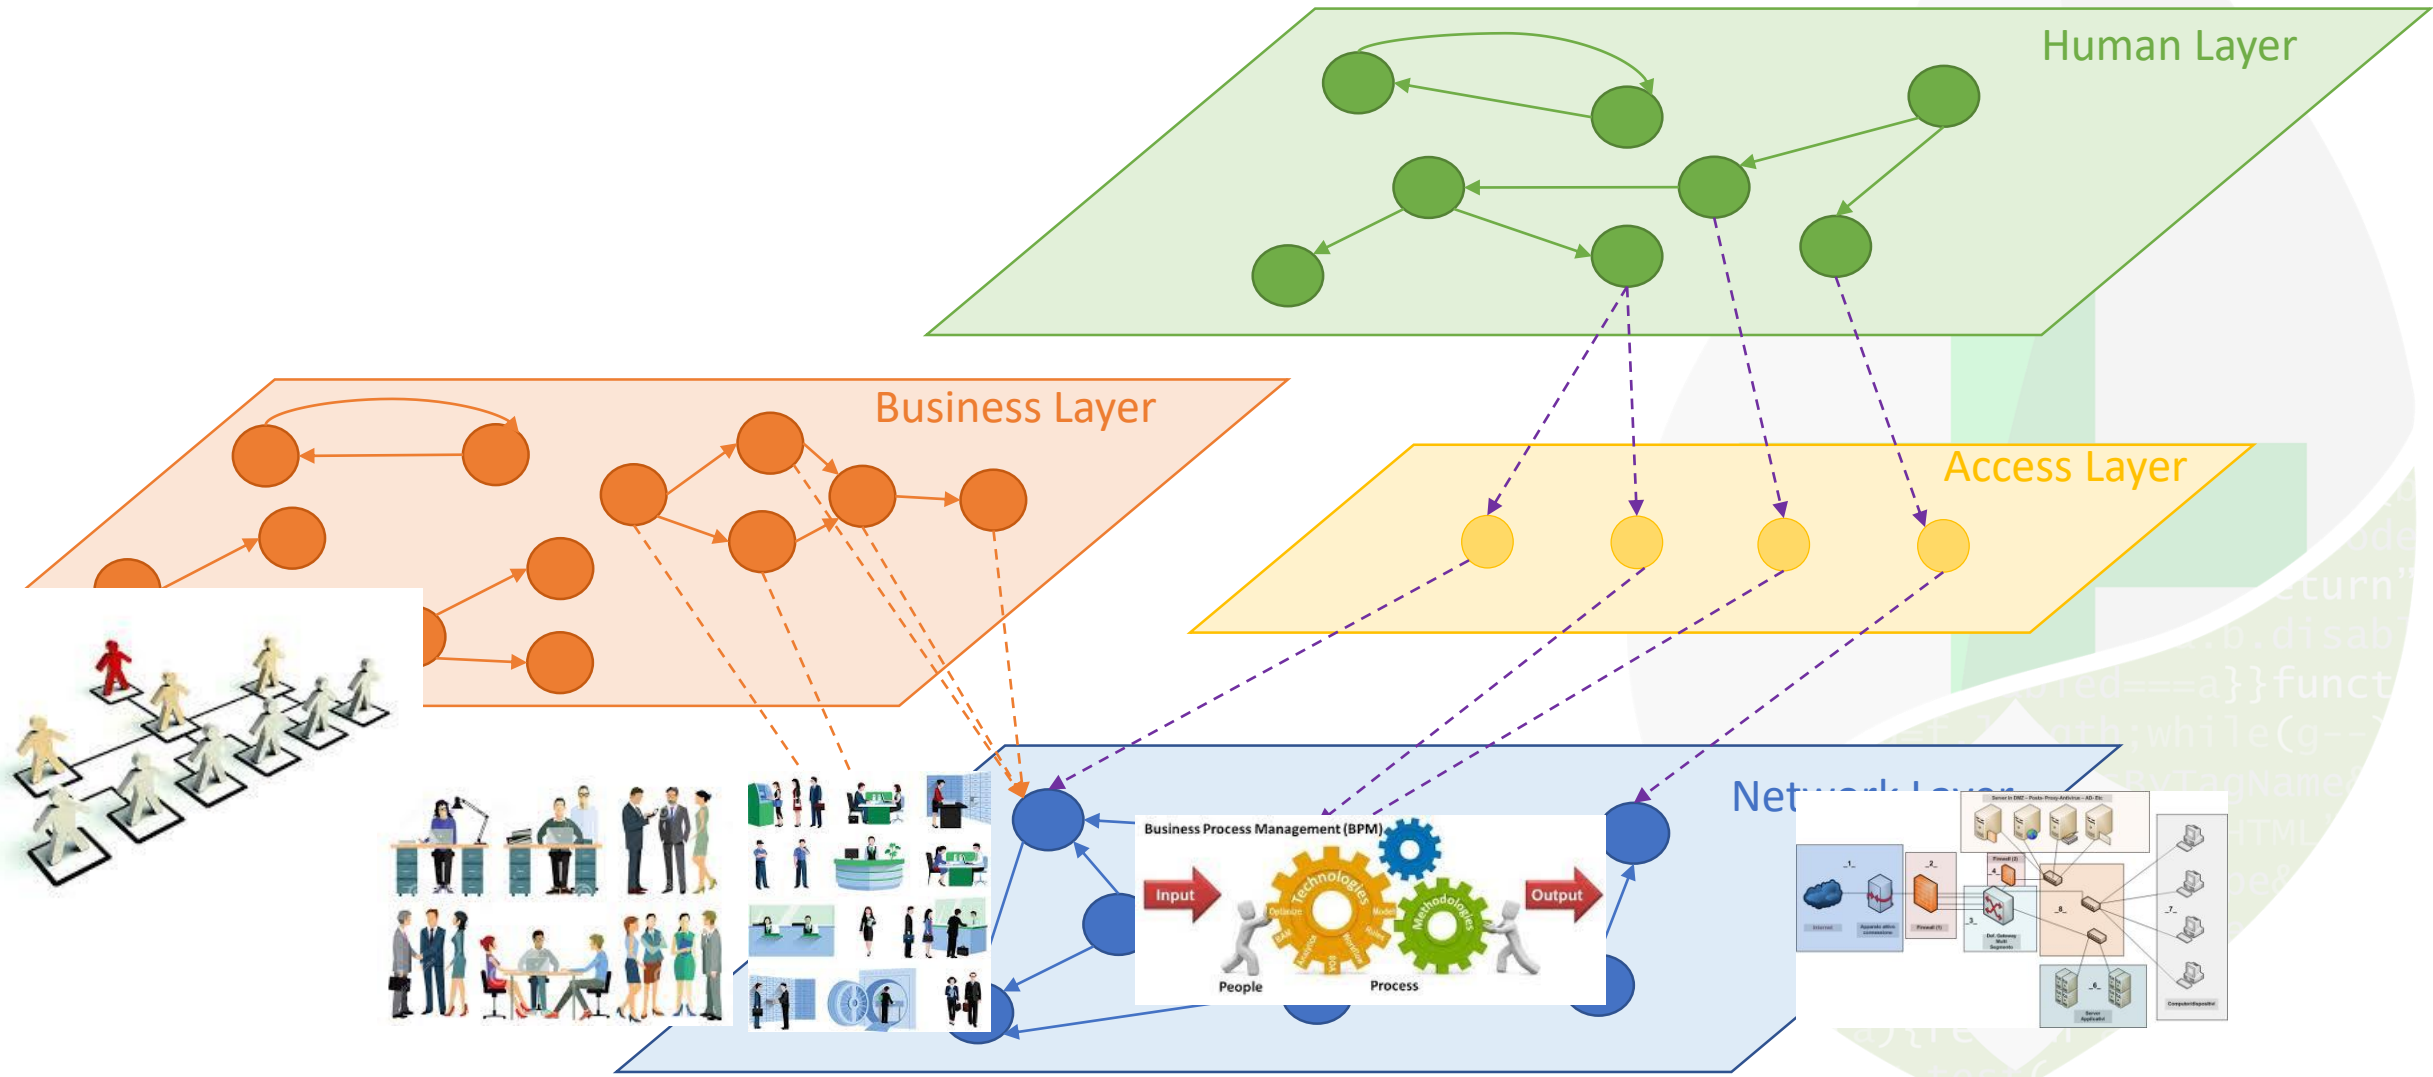

- Bugs
- Errors
- Backdoors
- ...

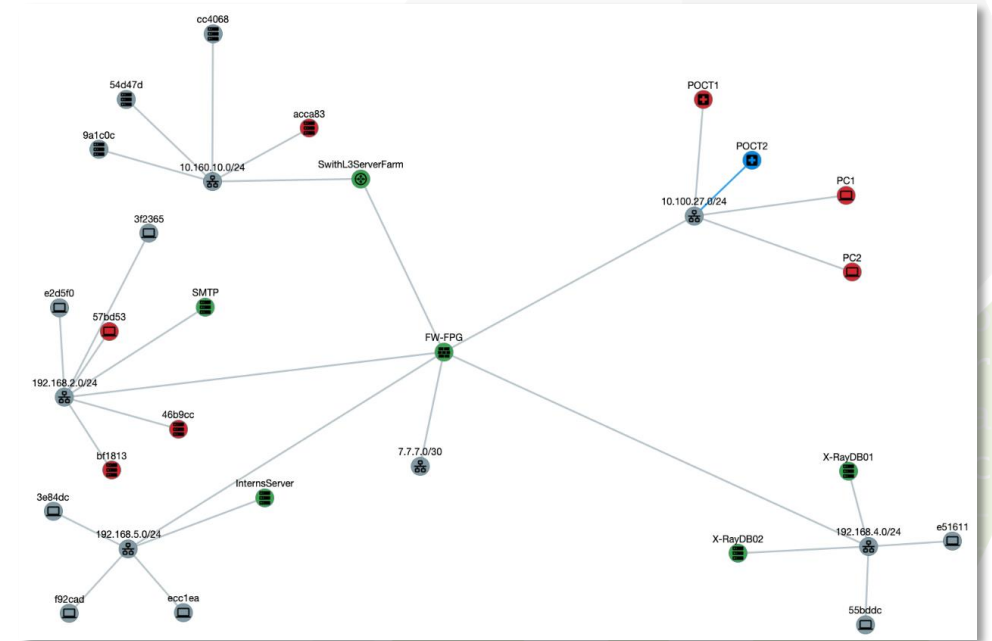

Health Care Organization (HCO)

# Our Model

# Modeling Network Layer

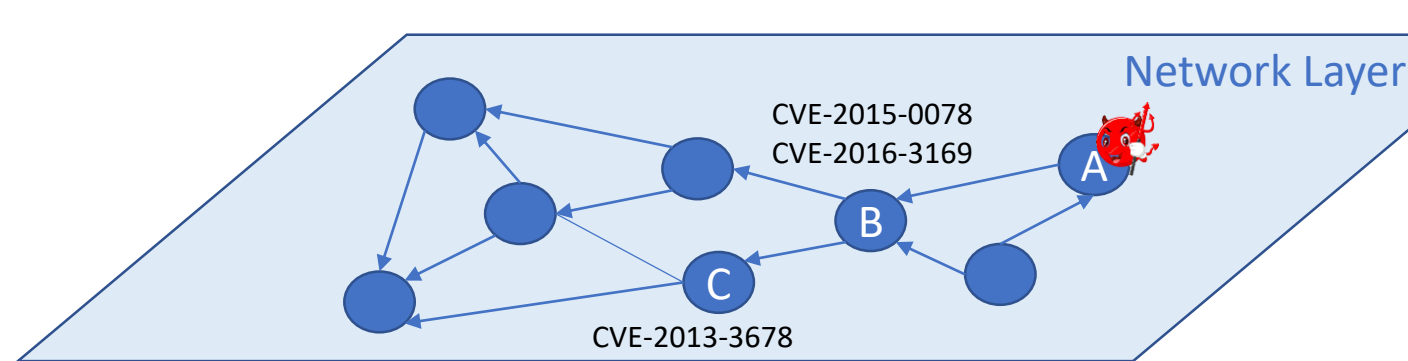

Every Node  $d_i$  is a Device

- Attached you can find
  - ▷ a list of its vulnerabilities (e.g., CVE-YYYY-NNNN)
  - ▷ Current level of privileges (e.g., None, User, Root)

Every Edge  $d_i, d_j$  represents the possibility to reach device  $d_j$  from  $d_i$

# Traversing the Asset Layer

| CVE-2013-3678  |  |
|--|--|
| Multiple unspecified vulnerabilities in SAP Governance, Risk, and Compliance (GRC) allow remote authenticated users to gain privileges and execute arbitrary programs via a crafted (1) RFC or (2) SOAP-RFC request. |  |
| <b>Base Score (CVSS v2)</b>  | 9.0 HIGH   |
| <b>Access Vector (AV)</b>  | Network  |
| <b>Access Complexity (AC)</b>  | Low  |
| <b>Authentication (AU)</b>   | Single   |
| <b>Confidentiality (C)</b>   | Complete   |
| <b>Integrity (I)</b>   | Complete   |
| <b>Availability (A)</b>  | Complete   |
| <b>Additional Information:</b>   | Provides unauthorized access<br>Allows unauthorized disclosure of information<br>Allows disruption of service<br>Allows unauthorized disclosure of information<br>Allows disruption of service |

# Modeling access to Data, Devices and Applications

- Every Node  $d_i$  represent a digital identity/credential
  - It is characterized by the type of credential (e.g., username-password, token, biometric, etc.)

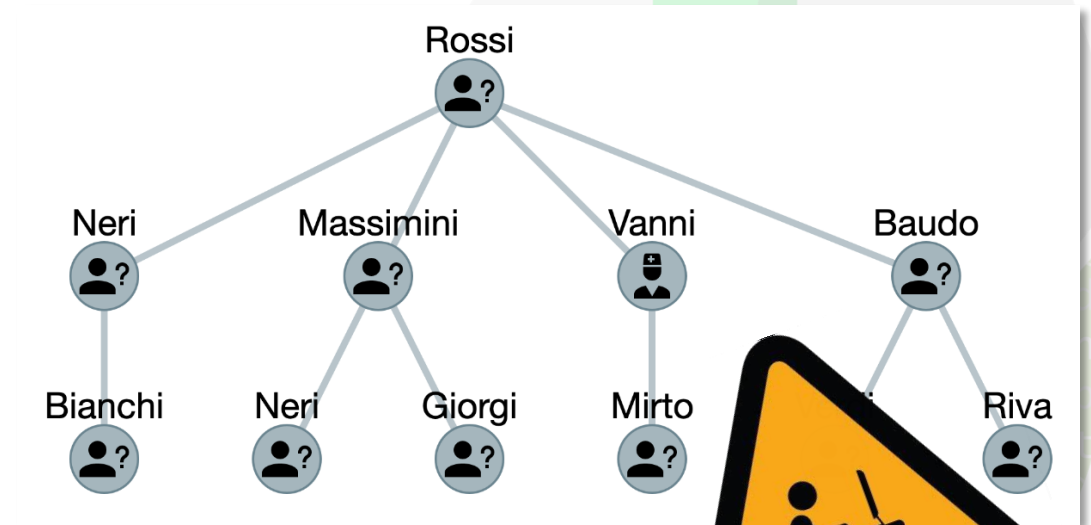

- Every Edge  $d_i, d_j$  represents the possibility to access device (or a specific application running on the device)  $d_j$  using credential  $d_i$  with privileges  $priv_{ij}$

# Traversing Access and Network Layers

# Modeling Human Layer

- Every Node  $h_i$  is a human
  - Attached you can find
    - ▷ a list of its vulnerabilities
    - ▷ a security profile

- Every Edge  $h_i, h_j$  represents the possibility to let  $h_i$  interact with human  $h_j$ 
  1. Interaction is possible due to working collaborations or to physical proximity
  2. Interaction is characterized by an intensity  $int_{ij}$

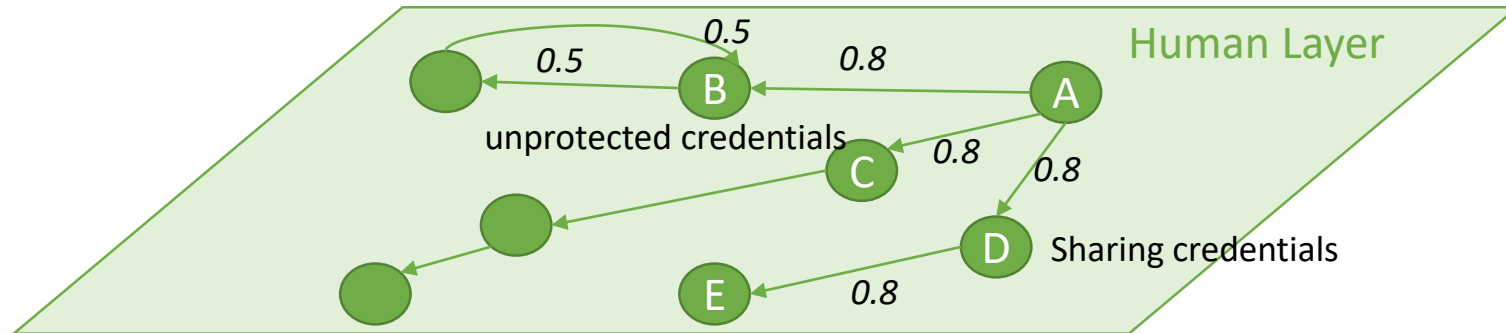

# Human Vulnerabilities

We identified a preliminary catalogue of human vulnerabilities and metrics to define security profiles

| Human Vulnerability List   |
|--|
| No 'logout' when leaving the workstation   |
| Disposal or reuse of storage media without proper erasure                        |
| sharing credential   |
| Unprotected credential   |
| Poor password management   |
| Insufficient security training   |
| Incorrect use of software and hardware   |
| Lack of security awareness   |
| Unsupervised work by outside or cleaning staff                                   |
| e-mail misuse  |
| non-compliance with procedures for introducing software into operational systems |
| non-compliance to policy on mobile computer usage                                |
| insufficient 'clear desk and clear screen' policy                                |

| Security Profile                           | Qualitative scale ? | Quantitative Scale? |
|--|---------------------|---------------------|
| Individual Security attitude               | Low, medium, High   | e.g., in [0, 1]     |
| Security behavior                          | Low, Medium, High   | e.g., in [0, 1]     |
| Security culture at work                   | Low, Medium, High   | e.g., in [0, 1]     |
| Security training                          | Low, Medium, High   | e.g., in [0, 1]     |
| Trust in colleagues                        | Low, Medium, High   | e.g., in [0, 1]     |
| Trust in physical security of the building | Low, Medium, High   | e.g., in [0, 1]     |

# Traversing Human Layer

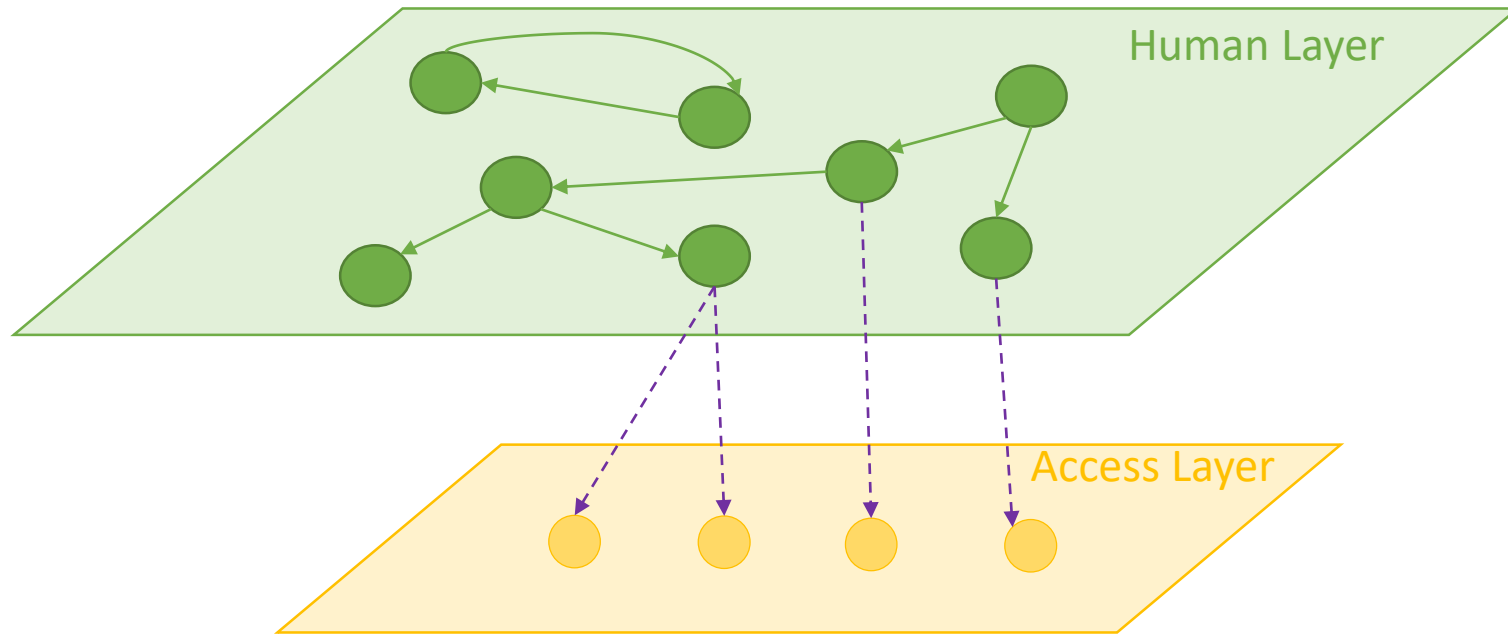

The effect of the exploit is that the attacker can impersonate D

The effect of the exploit is that the attacker can influence E in sharing information or accessing services

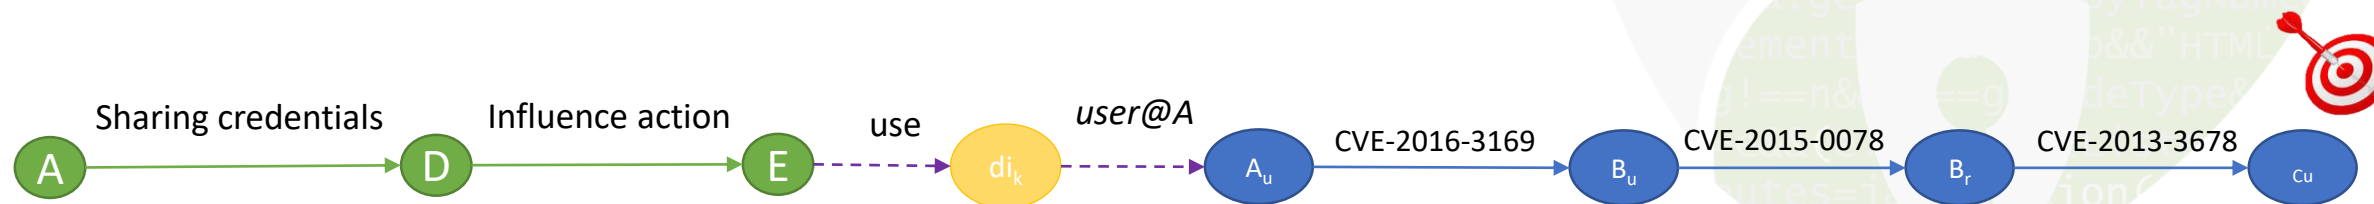

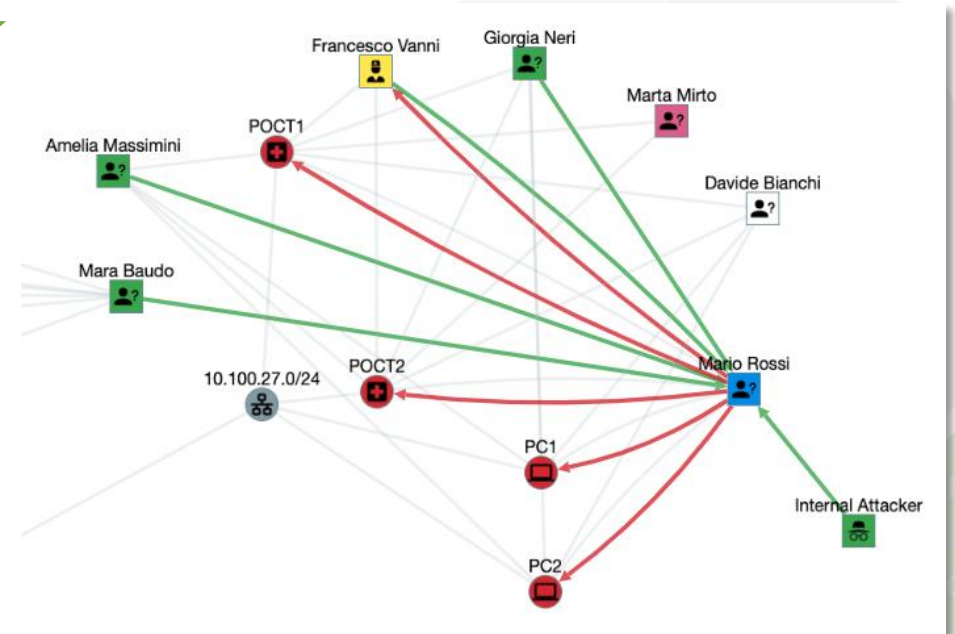

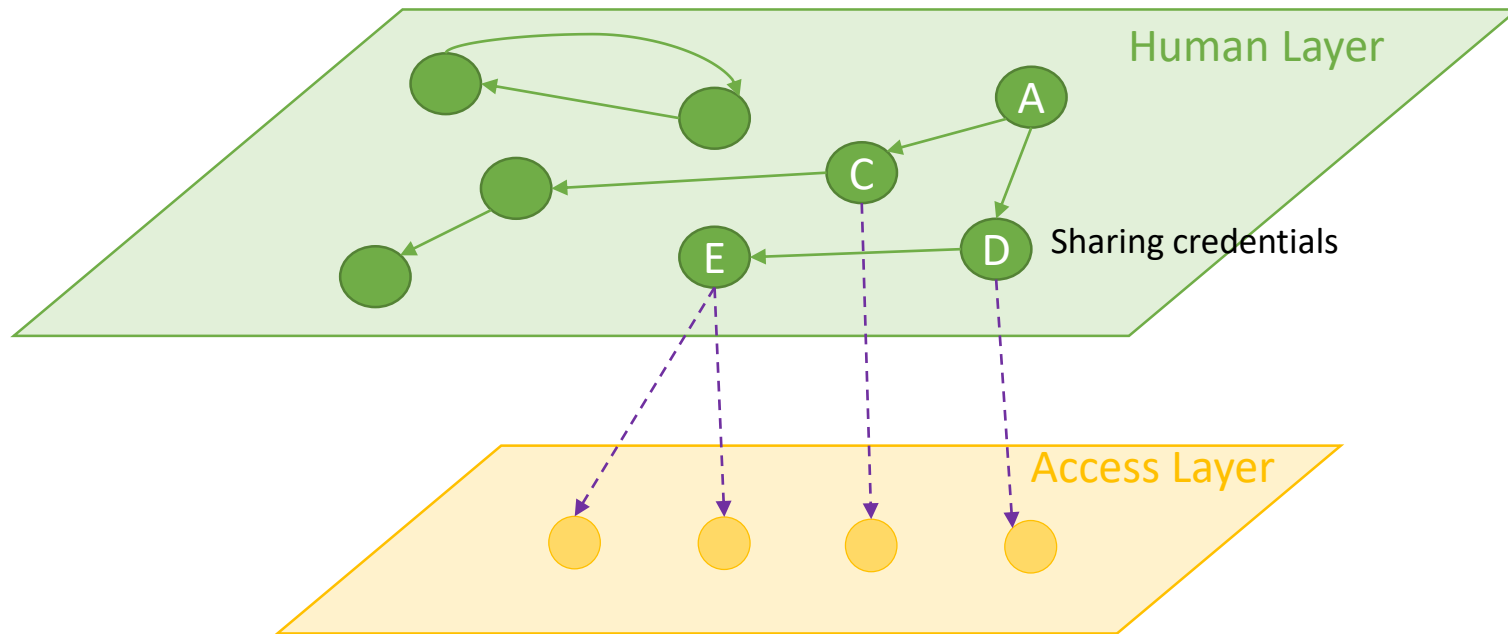

# Modeling credential ownership

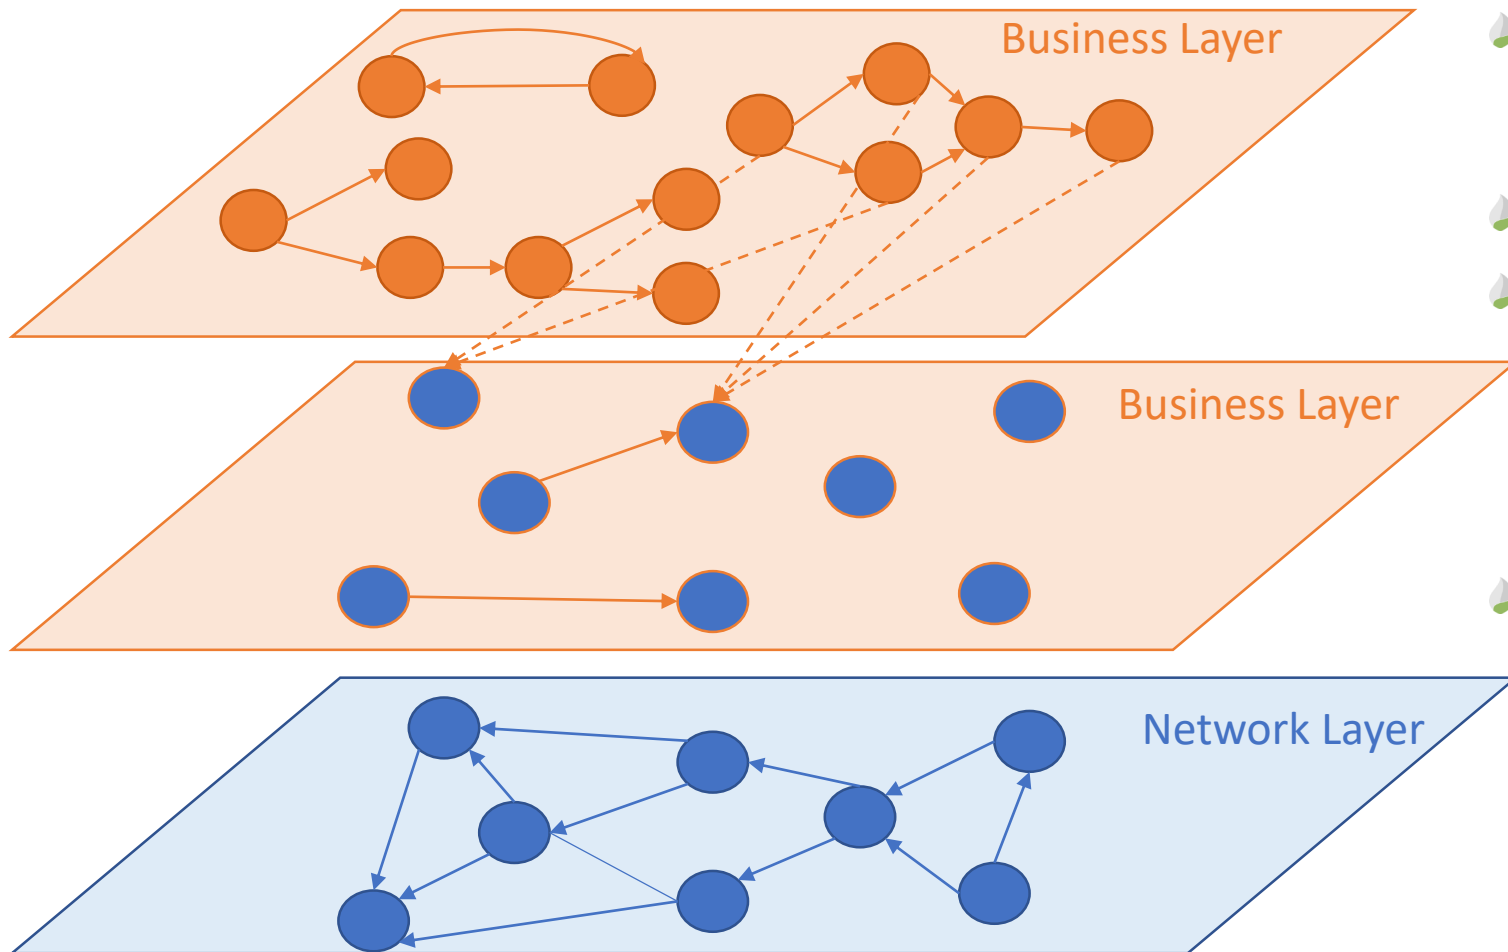

Every Edge  $h_j, di_i$  represents the possibility for  $h_j$  to use credential  $di_i$

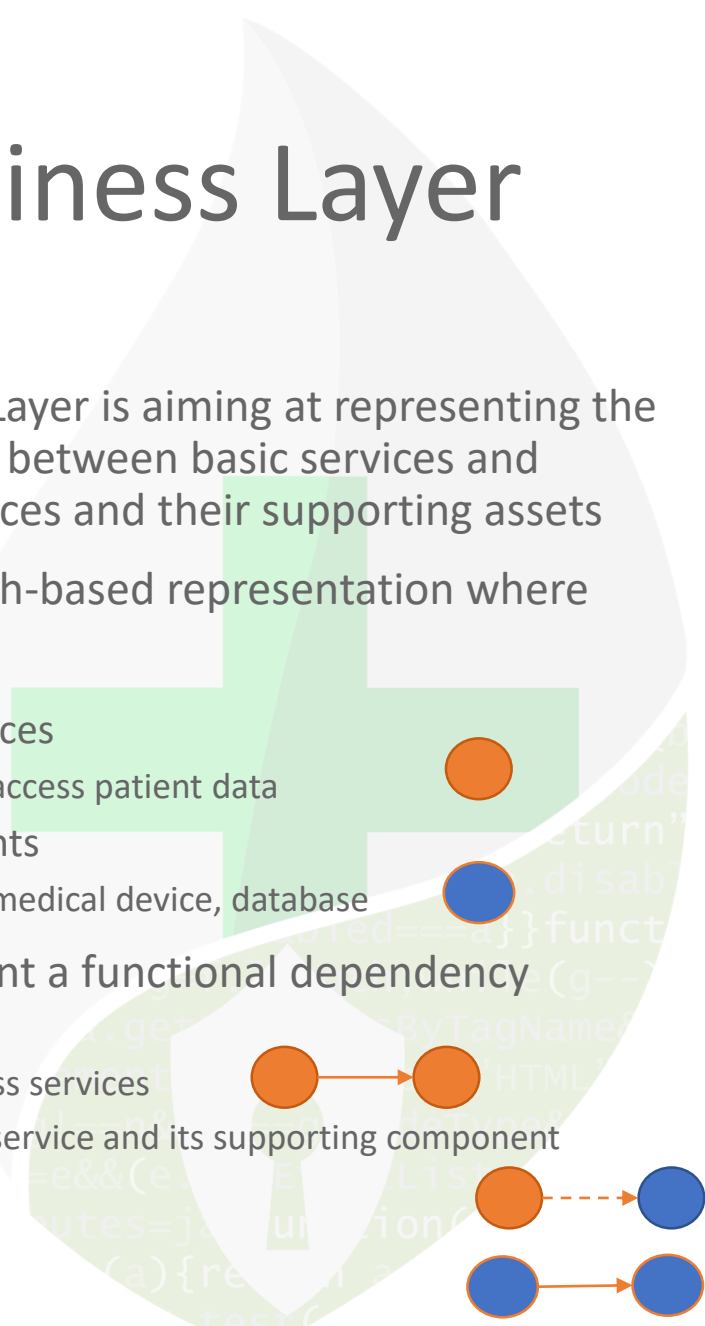

# Traversing Human and Access Layer

# Modeling Business Layer

- ▶ The Business Layer is aiming at representing the dependencies between basic services and between services and their supporting assets
- ▶ We use a graph-based representation where
- ▶ Nodes are
  - Basic services
    - ▶ e.g., access patient data
  - Components
    - ▶ e.g., medical device, database
- ▶ Edges represent a functional dependency between
  - Two business services
  - A business service and its supporting component

# Service level

Each service can provide its function at different service levels depending on the state of the system

Confidentiality

guaranteed, violated

Integrity

intact, corrupted

Availability

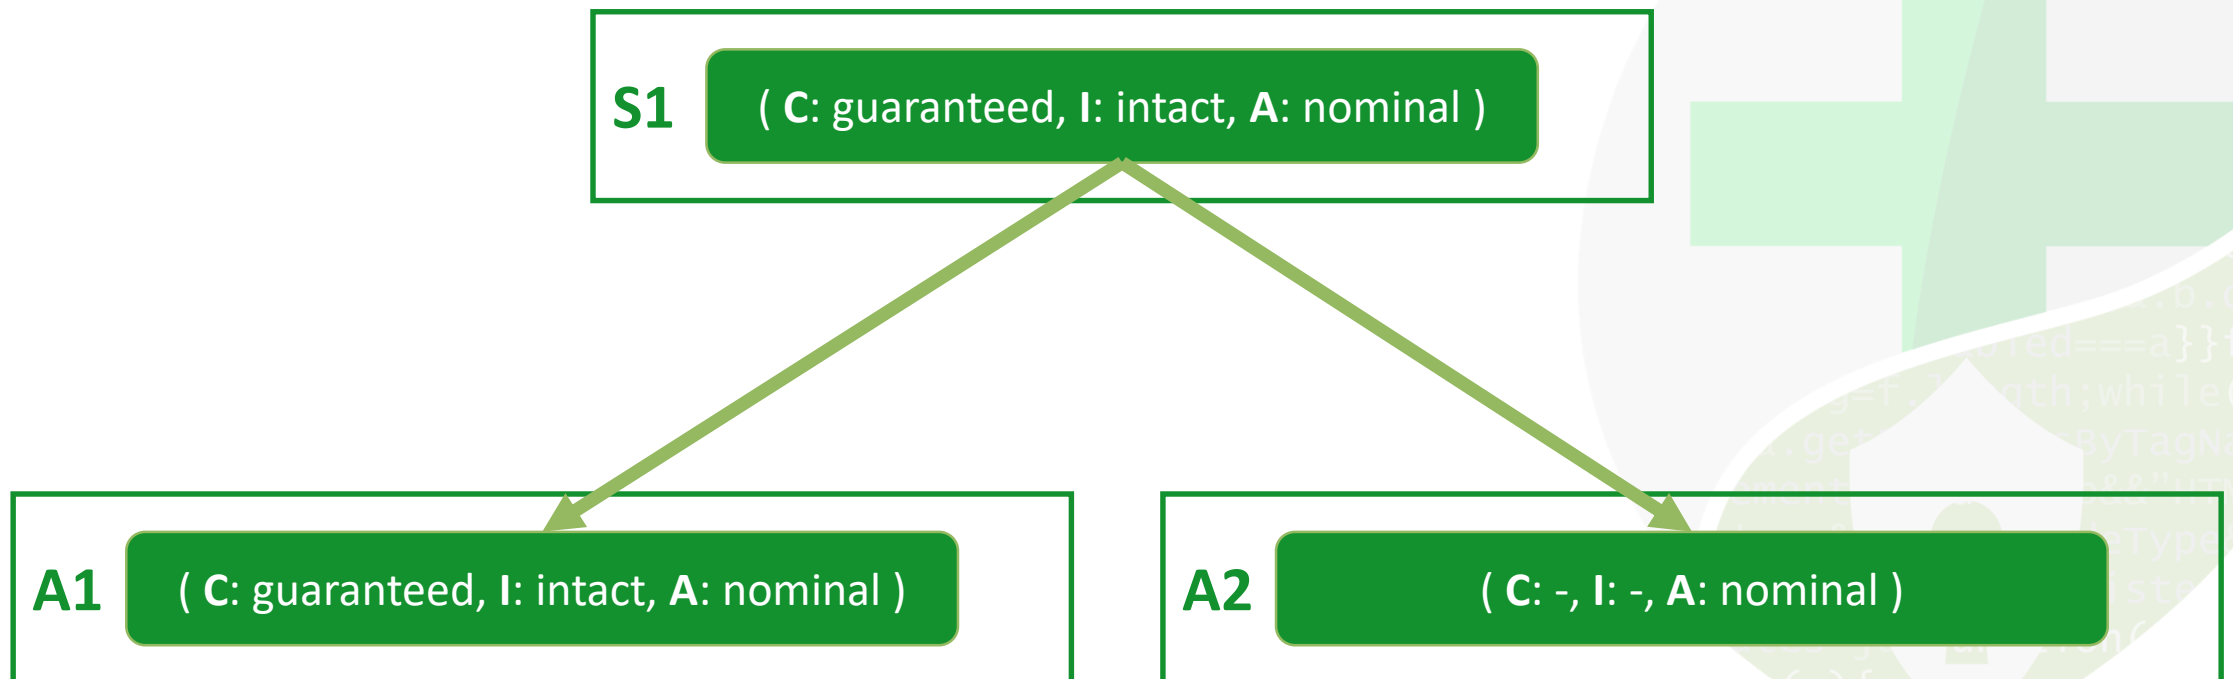

nominal, degraded, disrupted

e.g., ( **C**: guaranteed, **I**: corrupted, **A**: degraded )

# Dependencies

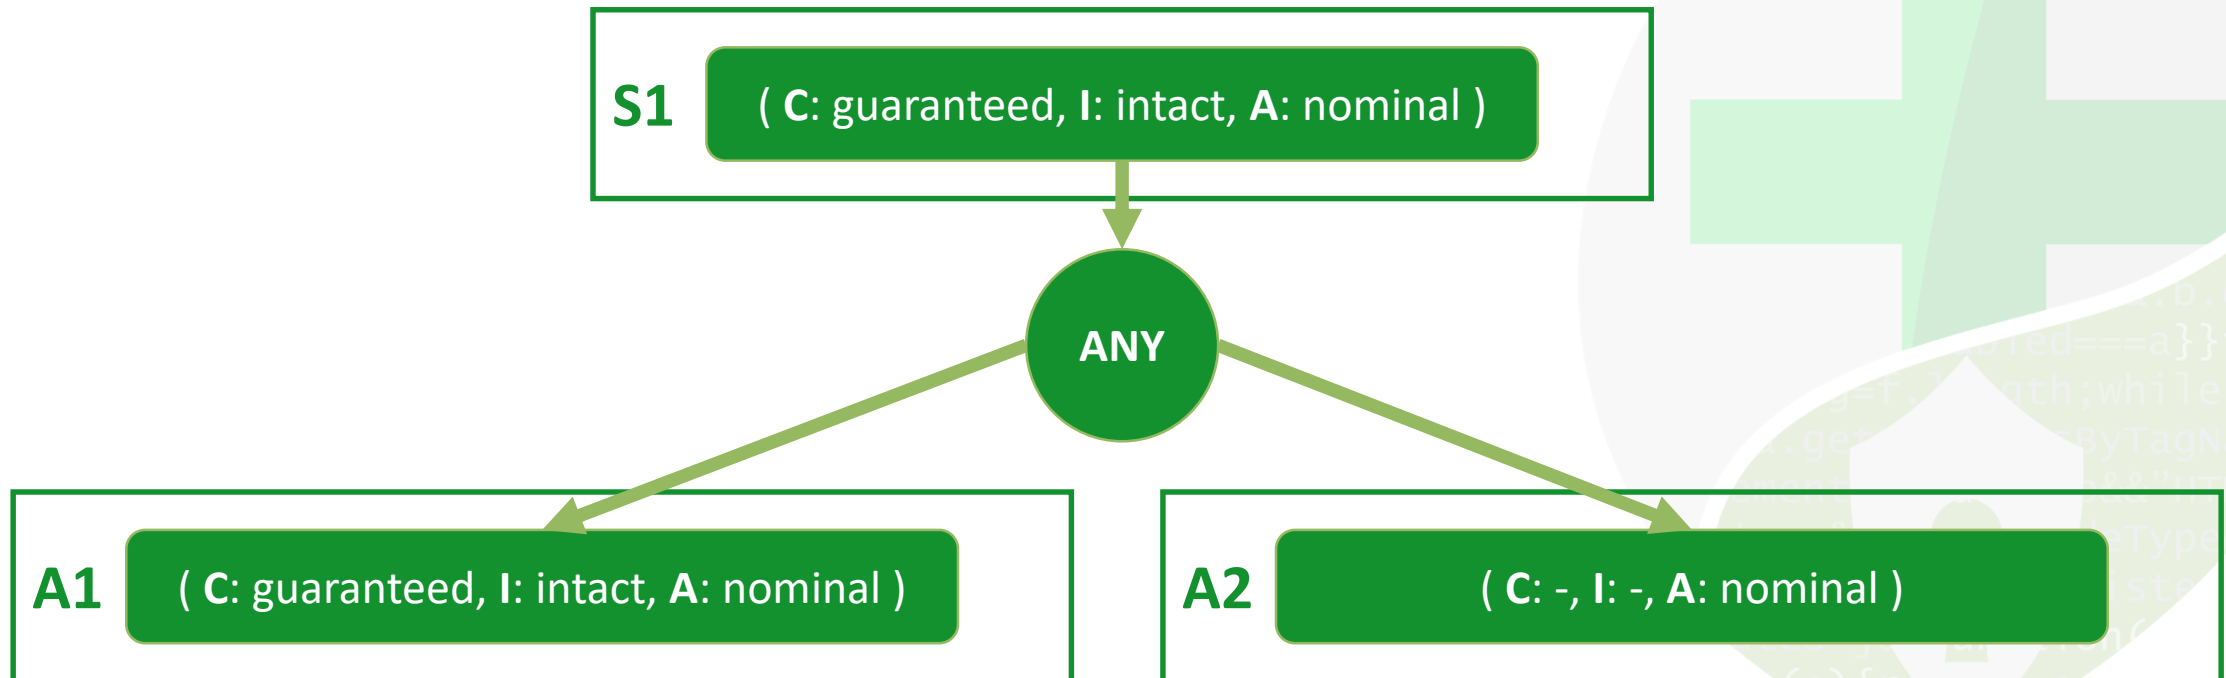

- Guaranteeing a given service level on a given element may require a minimum service level on other elements

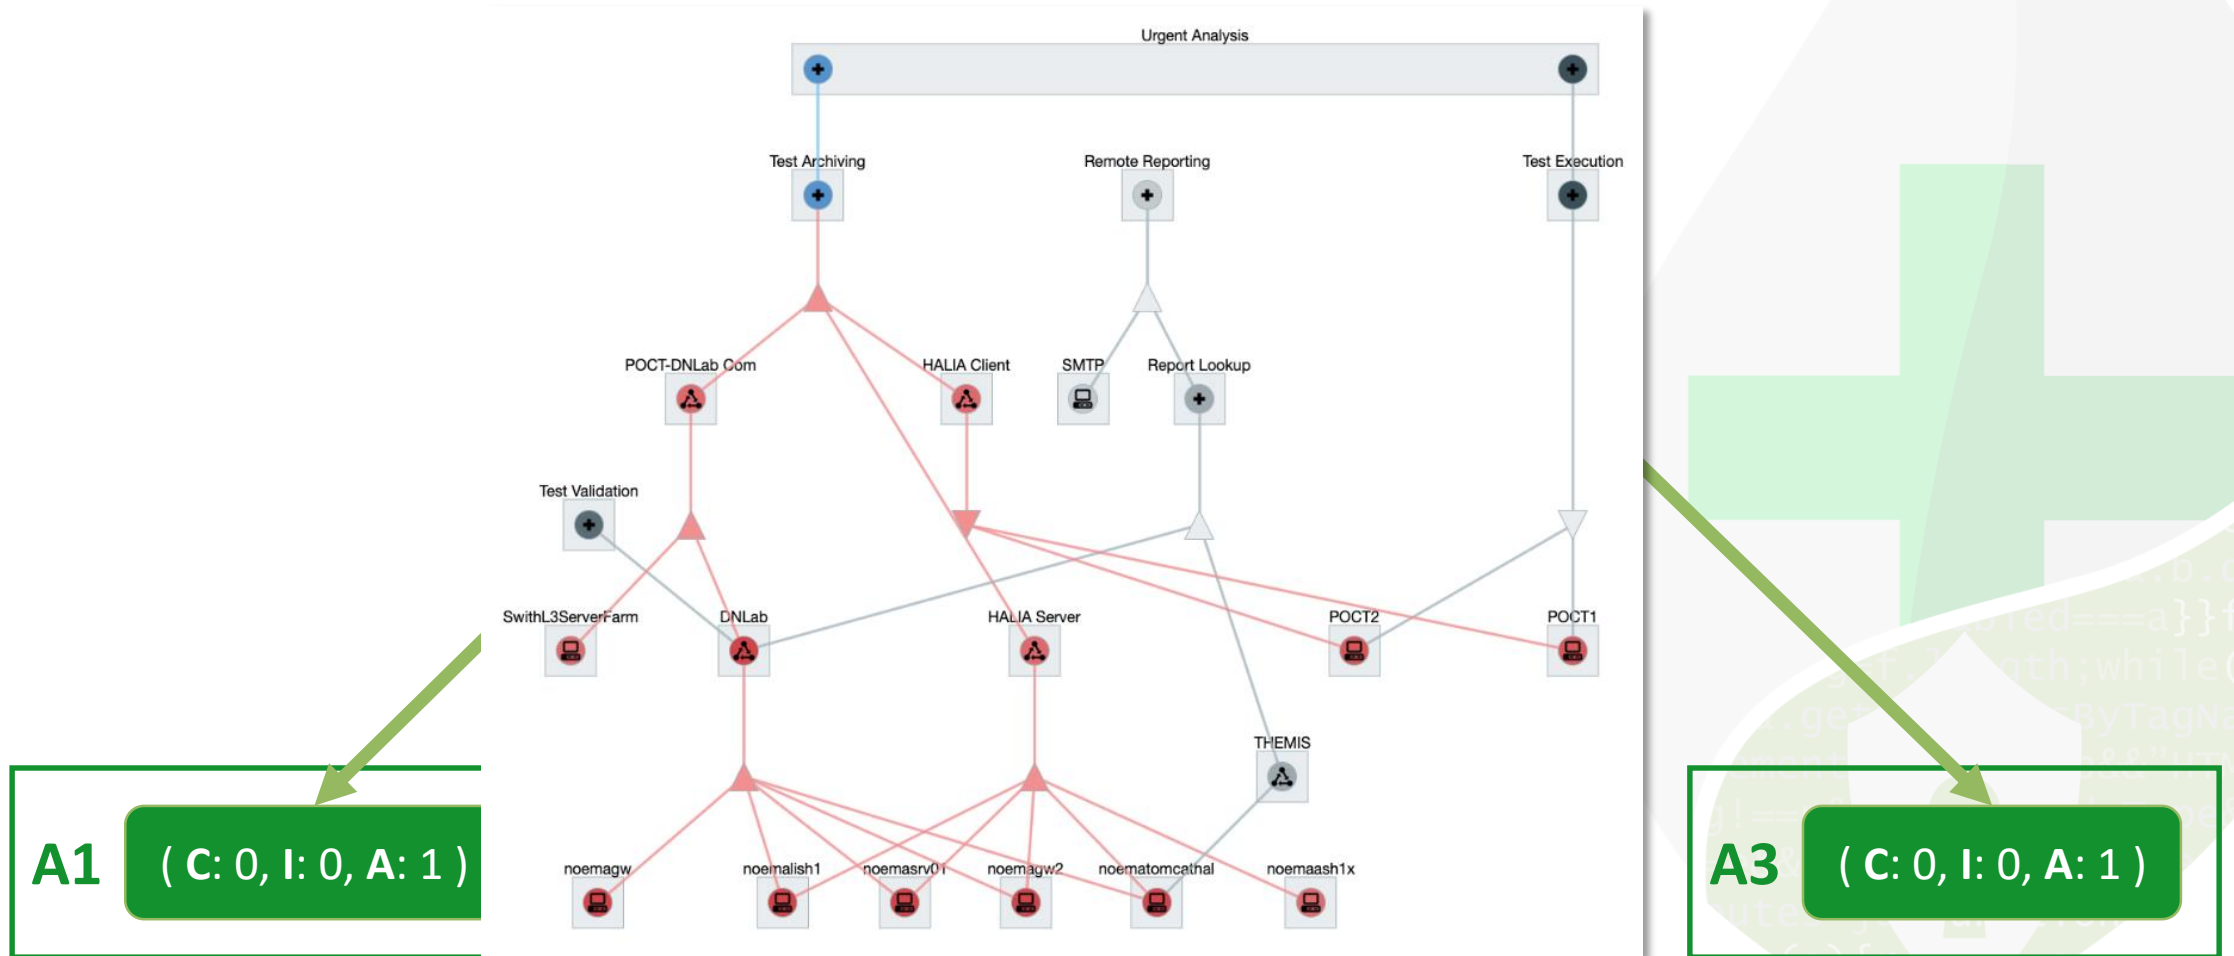

# Dependencies

- Normally, dependencies must ALL be fulfilled while other configurations can be expressed with the ANY operator

# Dependency Graph Example

# From Graphs to Risk

## Execution & Rem. Reporting

**Remote Reporting** IMPACT: 0.4  
 C: GUARANTEED  
 I: INTACT  
 A: NOMINAL

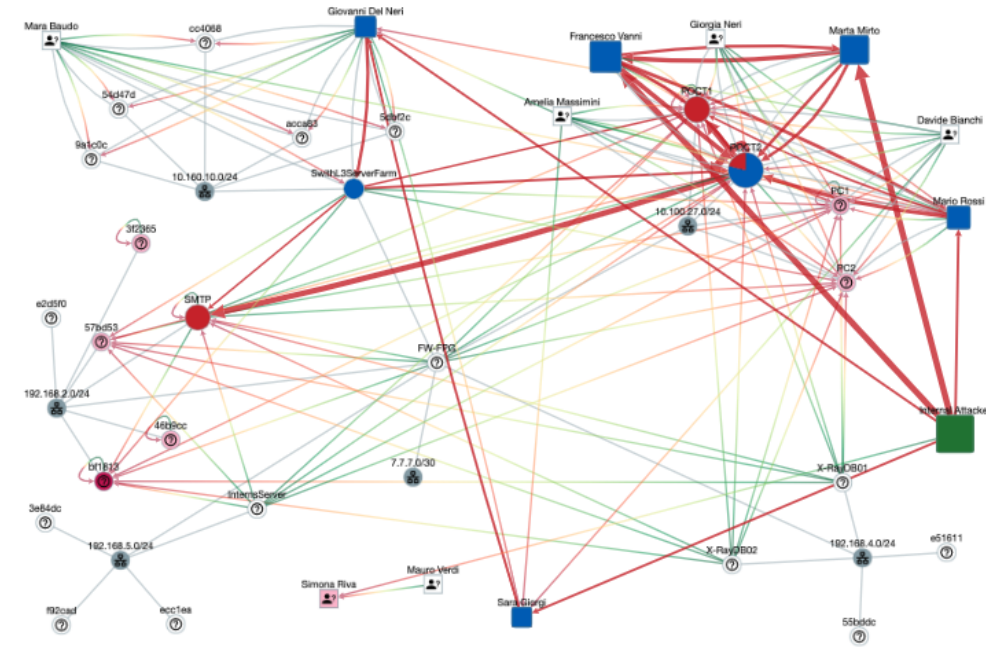

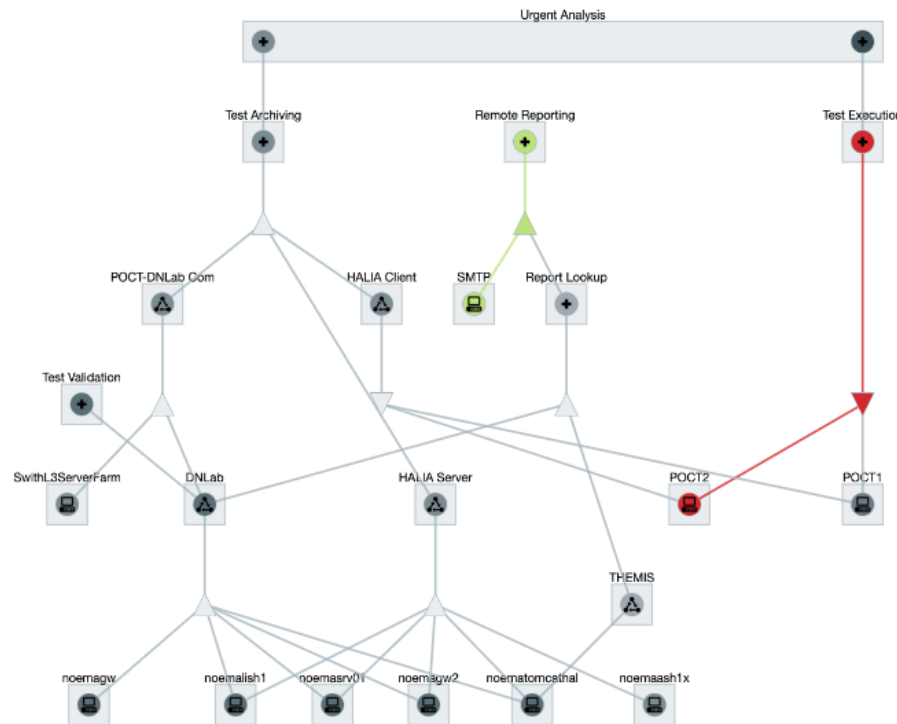

**RISKS**

|      |      |      |
|------|------|------|
| NAI  | ADV  | PRO  |
| 0.00 | 1.09 | 1.09 |

**Test Execution** IMPACT: 1  
 C: GUARANTEED  
 I: INTACT  
 A: NOMINAL

**RISKS**

|      |      |      |
|------|------|------|
| NAI  | ADV  | PRO  |
| 0.00 | 2.71 | 2.71 |

# Risk Computation

- DRMP can support the evaluation of the following risks
  - Full compromising of a business process  $BP_i$
  - Compromising of a specific service level for a given  $BP_i$
  - Compromising of an asset

*Thank you!*  
*Questions?!*
